

When you need to repair or replace a section of natural gas pipeline, the Reserve Companies can help you save gas and dollars, avoid releasing toxins and fugitive emissions into the atmosphere and prevent exposing your personnel and the public to the noise and risks of blowing down a pipeline.

Reserve will mobilize quickly to your site, safely connect specialized, state-of-the-art equipment to your pipeline and transfer the bulk of your pipeline's natural gas down the line toward your market.

Reserve completed its first pipeline evacuation project in 1975. We have performed evacuation services at thousands of sites, using from one to ten portable units. We have evacuated lines as short as a single pig trap and as long as 700 miles. We have evacuated lines from 2 to 46 inches in diameter, with initial pressures ranging from 50 to 1,200 psig down to less than 10 psig when required. Some jobs require weeks of operation. However, some require only one hour. A typical project is completed in 48 hours. Whatever your project scope, we can efficiently and safely tailor our services to meet your needs.

Reserve's pipeline evacuation service comprises a highly mobile mix of knowledgeable and experienced service personnel and quality equipment and supplies that go anywhere you need for as little or as long as you need.

Contact our Service Center at (713) 939-8988 today for more information on how you can save money and improve environmental performance during your next pipeline project.

SERVICES PERFORMED BY RESERVE EQUIPMENT

PIPELINE EVACUATION

Compressors evacuating pipeline

MOBILE COMPRESSION

Compressors pulling gas off a separator during pigging operations

PRESSURE BOOSTING FROM LNG VAPORIZERS

Compressors transferring vaporized LNG to supply pipeline

TEMPORARY COMPRESSION

7 units providing temporary compression during station outage
