

THE ENERCLEAR METHOD

Our Three-Stage Process

CLEANING

A combination of mechanical and chemical cleaning takes place in this initial phase. Utilizing pressured air, chemicals, and pigs remove scale, sand, rust, wax, and even barnacles as pictured here.

PREPARATION

During this phase, the surface of the line is prepared by customized chemical treatments. Once the cleaning standard is achieved the line will be Neutralized, passivated and dried in preparation for applying the two-part epoxy coating. This ensures the protective coating will protect the pipeline for years to come.

COATING

Coating is selected and vetted based on application technique, service conditions and lifespan to maximize protection against the media flowing through the pipeline. This will prevent future degradation and maximize the life cycle of the asset.
