

CLEAN
COMBUSTION
— INC —

**Advanced Equipment,
Traditional Service.**

About Us

Clean Combustion, Inc. specializes in pipeline services including:

- Flaring
- Flare Data Collection
- Filtration and Separation
- Custom Flare Design and Fabrication

We are focused on providing the best level of service to our customers through preparation, communication, execution, and continuous improvement. CCI is a specialty services company that offers superior equipment along with proven and experienced personnel. Taking a personal approach, we care for every project as if our livelihood depends on it – because it does.

Personnel

Our personnel work with our clients in order to plan projects that can be executed without compromising safety or quality. Through training and peer observations (Behavior Based Safety Plan) as well as our participation in hazard assessments, JSAs, site specific safety plans, etc., we maintain the safest and most efficient service offering on the market. Our field supervisors and management team have more than 115 years combined experience in pipeline services.

Services

Flaring

CCI offers the most advanced portable flare stacks in the industry. Our units are equipped with air assist and multiple tip configurations in order to operate at maximum efficiency with a wide range of hydrocarbons. All units are completely self contained, erected hydraulically, and equipped with secondary containment. The designs allow them to be rigged up and ready to go in a matter of minutes. This eliminates costs associated with air compressors, cranes, or other equipment that might be required with other flare stacks on the market.

Flare Data Collection

Environmental compliance is easy with CCI's data collection and reporting packages. CCI can monitor and record flow rate, total flow, calorific value (btu content), flare tip temperature, and flare gas composition (gas chromatograph). The data is compiled in a flare event report in order to satisfy the site's requirements.

Heated Commissioning

CCI's tube and shell heat exchanger system has become the preferred method of pipeline commissioning for many operators. CCI vaporizes the hydrocarbon before injecting it into the pipeline to minimize interface and flared product. This also prevents brittle fracture, which is a cause for concern when commissioning lines with many products.

Filtration and Separation

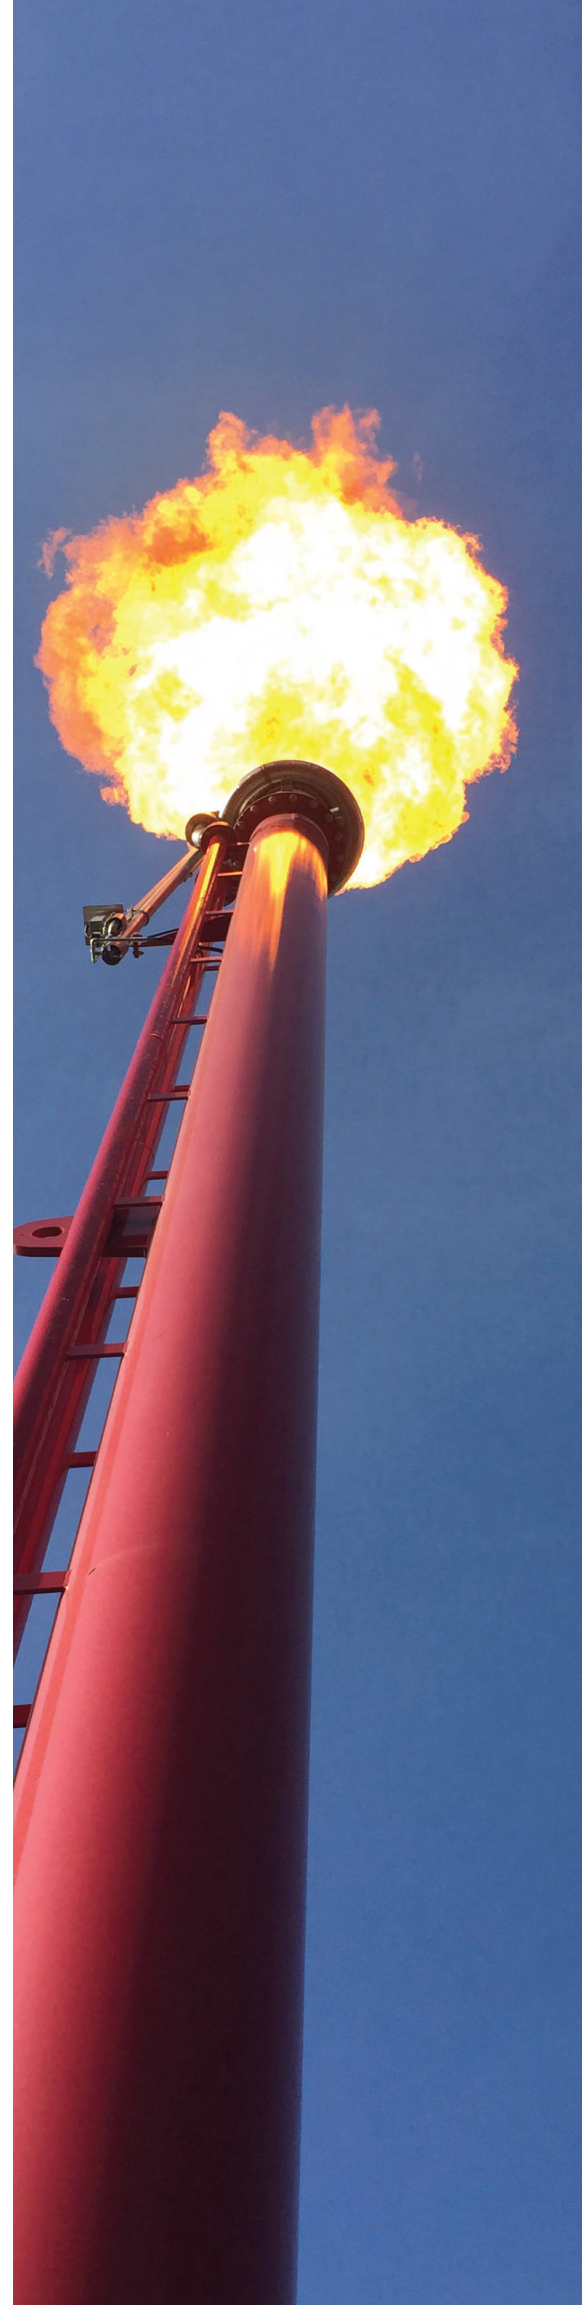

CCI can manage a complete hydrocarbon containment system for pigging or decommissioning of pipelines. We can set up systems for on line or off line separation, filtration, flaring, and liquids handling. Equipment used for this includes: high and low pressure separators, knock out vessels, coalescing filter separators, and storage tanks. An assortment of piping and instrumentation is available to complete the package.

Custom Flare Design and Fabrication

CCI uses our expertise to design and fabricate a custom flare system for customer's facilities. We approach each project individually and do not offer a one size fits all product. CCI has designed and built flare systems for:

- Pipeline pump stations
- Well sites
- Fractionation plants

Safety / Quality

Safety is a core value for CCI. We know that when a customer hires us, we become an extension of their company, and want to extend their safety culture into ours. We use many tools to help ensure that our projects are completed safely from start to finish. We are proud of our record, and constantly work to keep it up.
